0:02 - Sudeb Bibaswan
Four people, so uh, one of us won't be able to join because he's in flight right now. So, uh, so we have three of us now to continue. Uh, so optional.

0:21 - Abhisshek Raaj
Three of you for this problem statement, right, right, sir. In the entire team, uh, yes, no.

0:28 - Sudeb Bibaswan
We are the team a member of the total four people in the team. So one of you. Yeah, he's in a flight and so three of us here.

0:36 - Abhisshek Raaj
Sure, no worries. So we can quickly go through it. If you can help me understand what is going be the format once you have the briefing of the problem, what is the next step that you guys are going to do and what is the final outcome that would look like,

0:51 - Sudeb Bibaswan
right, right. So, basically, we are team seven. I believe you might have an idea about the problem shipment already.

0:57 - Abhisshek Raaj
Yeah, yeah, I have only given it, so don't worry about it. Yeah, yes, yes, sir.

1:00 - Sudeb Bibaswan
So, basically, that's the reason I asked. So, so, so, we are, uh, so we have identified about like uh four main problems. So, out of them, two are major. So, one of the first one is the documents, the invoicing documents have different formats, different industries. There is an issue with calibrating.

1:19 - Abhisshek Raaj
Your team is going to work on only this problem statement, right? The one that I have shared with you.

1:24 - Sudeb Bibaswan
Right, the knowledge engine one, yeah.

1:26 - Abhisshek Raaj
Yeah, yes, got it.

1:29 - Abhisshek Raaj
So, what will you do after that is what I'm trying to understand. Once you understand the problem, are you going to build an AI tool which is going to solve for it? Is that what you're going to do with it?

1:41 - Akshat Jain
Sir, what we had planned is an hybrid rack system because there are multiple drop-off points in the whole funnel of processing the invoices. So what we thought is basic rack system was.

1:55 - Abhisshek Raaj
I'm not talking about invoices, I'm just focusing on this problem statement. I will focus on the problem statement that I have given. And I'll brief you about it. What I want to understand is what is going to be your output. I believe you have something as a presentation on 16th, right?

2:13 - Sudeb Bibaswan
Actually we had one presentation already yesterday actually. So I think this call was supposed to happen a little bit sooner, but just delayed for some reason. So we had one disc quick I have kind of a check-in call with Diveshesir yesterday itself. Okay. So we kind of told you about the problems we found were relevant issues, yes, and post that basically the breakdown problems, So let's do one thing.

2:40 - Abhisshek Raaj
We have around 20-25 minutes. So let's focus on the problem statement which we are going to discuss.

2:46 - Unidentified Speaker
Right, right.

2:47 - Abhisshek Raaj
I want you to ask as many questions as possible so that you guys are pretty clear on what we are trying to solve. Okay.

2:55 - Unidentified Speaker
Thanks.

2:55 - Abhisshek Raaj
And before that, a quick intro. Not sure if we have met earlier. I have come to Master Union for a few sessions, a few masterclasses. So I am Abhisshek Raj. I have a total work experience of around 12 years in GenPact and currently I am with EY as an associate director. So I have worked in this AI, Gen AI, GenTech space for quite some time. Time and other than that I love to teach and hence I teach at almost all the IIMs, Mesa, Master Union, etc.

Love to interact with students and that's why I'm here on a workday. That's a bit about me. So quickly now switching gears and moving to the problem statement. First I'll give you a brief of what I have seen in the industry. Okay. And then we can discuss a bit about how should your approach be, what kind of solution would work, not work. Is that okay? Or do we have any other expectation from this session?

It's okay.

4:09 - Sudeb Bibaswan
Yes, sir. It's all right.

4:10 - Abhisshek Raaj
Yes, sir.

4:11 - Abhisshek Raaj
So first of all, what is your understanding of the knowledge engine, the problem statement that I had put in?

4:17 - Akshat Jain
any any understanding that you might be having beforehand okay so let me give you some exact speaker sorry what we understood was uh yeah sir am I audible yeah you are audible uh what we tried to do with the problem statement is we tried to break it down like chron in a chronological order properly to understand at what points uh we are we are lacking in these current current system that we had. Like the exception system, the m multiple document system, like the outdated SOPs with the new SOPs, the wait times on MST, the average wait time on MS team.

And the increase dependency what we had on senior level managers that is 58% of all the exceptions that are answered are answered by three managers and out of which one that is Akshat is leaving on hot ends so this is how we tried to break down the problem statement like and try to that's a good start Akshat and team uh so what I meant by this problem is think of it any organization, okay?

5:33 - Abhisshek Raaj
And I'm not sure if I have given anything in like that are happening in the overall yeah, so Akshay, what saying is, think large-scale organization, okay, not just service, not just manufacturing, not just a product organization. Any organization, this is a common problem. So, what happens is in the industry, what you will see is for any process that you can think of, let's say customer care. Okay, so what do I mean by customer care?

Let's say my credit card bill was not paid on time and I incurred a late fee fine. So, whom do I reach out to? I reach out to a customer care executive, right? Once I reach out to the customer care executive, depending on my problem type, he will try and solve it in different ways, right? So, what I have given you is one particular scenario. There could be multiple scenarios where I'll reach out to the customer care executive.

So for each and every scenario, there is a set of steps that they need to perform. So for example, if my payment was late on my credit card bill and there was a fine, the first thing he'll check and inquire is what was the payment date? And what was the last date by which you

should have paid? Was there any technical issue in the app because of which you could not pay? So, there will be a series of questions like that where he'll try to diagnose the problem, right?

So, all I'm trying to say is for each and every process, there is a set of defined steps that we design whenever we set up such processes, right? And we try and incorporate all of that in a standard operating. Document, which is your SOP document. Now, what happens? Let's say a few months down the line, if there is a change to the process, how will that SOP get updated? How will each and every person on the operation floor get to know about that change?

Right, it may so happen that out of 10 people who are working. Two of them that know already that you know a certain step has changed in this process. Instead of asking so and so things, we should ask this now. But the SOP was not updated in due course of time, or somebody forgot to update it. So, the rest of the people will still follow the same old ways, right? And that is going to create a lot of issues in the operations now.

Expand that problem to any process that you can think of I talked about customer care. You can think of finance operations where doing invoice processing. So over a period of time, few of the steps in invoice processing it changed, but the entire team is not aware, the not updated. Even if the SOP is updated, people are referring to the old documents, old SOPs, older knowledge. And somehow that change is getting lost.

People are still doing same set of mistakes which they should not do because the update has already happened. So what I'm trying to come to is knowledge, the entire knowledge set in an organization. How do you preserve it? How do you ensure that any change to the knowledge base is quickly reflected and is accessible by each and every person? Person. It should not so happen that only managers know about it because the managers are not the one who is going to work on the shop floor or on the operations.

Each and every agent, how do they get to know about it real time? And if they have further queries, how will it get answered? Until unless we solve for it, a lot of mistakes will keep happening, especially in service operations. Lot of changes that happen on a daily basis. Not properly captured. It gets lost. Either the versioning is not correct, let's say the SOP was updated, but nobody kept a track of the version control.

So instead of version 2, somebody is still referring to version 1 and they are doing the work in the old way, not the new way. Got it? So that is the challenge with this knowledge. Now, been talking about the SOP only. Think of it: lot a of knowledge in organization will come through this call let's say there is a video call in which the client is explaining to you that instead of doing this process in x fashion you have to do it in y fashion this meeting happened everyone forgot about it nobody went back and updated the sop that is also possible right akshir today if you are following me yes yes sir you're right yeah that is also possible that you do not go back and update so what happens to this knowledge this knowledge is lost right whatever time that we

have devoted for this meeting it is not leading to any outcome So how do we capture knowledge not just from SOP perspective but from different meetings, different walkthrough calls?

So what happens is many a times the client will tell us and show us exactly how a particular process will run. They will show us over video call. They'll show us over a team's chat or teams meeting. So there are multiple sources. Think of it. You can get such changes on your email. You can get it on your team's chat, you can get it through some video recording where they would have demonstrated the entire process, how it needs to be done on a video and sent to you.

So, now think of it: you have multiple sources of input: email, teams chat, video interaction, some PDF document that they'll send you, or some. Mails, messages, anything, think of anything, it can come in any form. Now your work is to collate all that information and ensure that your process is up to date with all the knowledge. Once it is up to date, how everyone is going to access to it, how everyone will get to know if they are referring to the latest one.

That is a big problem that all the organizations they are trying to solve. That is where AI comes into picture. How can you leverage AI to solve this problem for organizations? And trust me, if you do this, this is a million-dollar problem in the industry. So I'm not giving you any hypothetical problem. A lot of big companies, billion-dollar companies, are struggling with this. If you manage to solve it, it's a million-dollar problem.

So I'll take a pause. For any question for anything that you want to understand better.

12:31 - Akshat Jain
Okay sir, so like we got your point and what I would like to like add this is till this point, like till before this call, what we were thinking like or how we are taking this problem statement is to fix a knowledge base that is to fix the latest SOP as your knowledge base. And process the entire flow on the basis of that. But after whatever you said, I kind of concluded it like you are trying to say that in organization, these SOPs get constantly updated.

13:06 - Abhisshek Raaj
So just a point I will. So what you have told is 100% correct. That is the main problem. However, it is not just SOP document. The knowledge could flow in any format. Right? It can come through in a client video, it can come through a training session that the client has conducted for you, it can come through some email, right? So, just a few lines written on the email that instead of processing invoices in three steps, now from now on, you do it in two steps.

It could be as simple as that. So, there could be multiple sources of information. Your problem still remains the same. How do you collate all these information, these changes, put that back to the SOP and ensure that everyone is following the same document, same set of knowledge base for doing the processes?

13:59 - Akshat Jain
Okay.

14:00 - Unidentified Speaker
Okay.

14:01 - Akshat Jain
So what I understood is you are trying to say to focus more on accumulating a single knowledge base from multiple sources and maintaining that what we call knowledge graph kind of a thing to keep it updated and then do the follow-up process. Correct.

14:19 - Abhisshek Raaj
Now the challenges that you will encounter, like I said, you have to first collate the changes from multiple sources, right? Could be in any form. Second, you have to ensure that all of that gets updated in a timely fashion. In many processes, you will see the changes keep happening on a weekly basis or every alternate day. It could be as dynamic as that. So you need to capture it at the right moment.

You need to ensure that it is updated and everyone has access to it. It should not be kept in a way that. There is a centralized folder, a SharePoint, wherein only managers can access it. How do everyone access it? And think of it: any process for that matter will have SOPs which is running in at least 50 pages, 60 pages. I, as an agent, when I encounter a problem, I will not read the entire 60 page, will I?

You as students, you as students, when you have to revise any particular topic, you will not go through your entire semester notebook, will you? You will go to that specific chapter, that specific section, where you will find your answer, correct? So how do you reach there? Because most of the work that you do, it is done in seconds. Invoice processing that happens, it's a matter of you know five or ten seconds.

I cannot sit there, look for all the updates, go through each and every line, and then do my work. I will not have that much bandwidth. Yeah, so end-to-end this is your problem. Yeah, you have to build a solution which can do all of this, and I, as an agent or as an operator, as a team member on the operations floor, I should be able to, you know, just do my work. I should not focus on, oh, is it updated?

Okay, I have seen something in my email which came two days back. Can I go back to my email and check? If I keep doing that, I will lose time and I'll not to perform my work. Yeah. Right? So, this is a big problem in industry. Trust me. You will see this in each and every company that you can think of of If you manage to solve it, it's a big, big win.

16:53 - Akshat Jain

So sir, we should focus more on knowledge base than the after process of the knowledge base is kind of

17:01 - Abhisshek Raaj
I want you to focus on solutioning this end-to-end. It should solve for each and every problem. Your solution should solve for each and every problem. Okay. I'll not spell it out for you. You, but people are already working on it and there are few solutions around it.

17:22 - Akshat Jain
Okay, so we'll definitely look at those existing solutions. You don't have to look at the existing one.

17:27 - Abhisshek Raaj
What I would recommend you is to first break down this entire thing into four or five problems. It's not a single problem if you would have understood so far. So first break it down in multiple problems. Come up with a solution which will solve each and every problem. Now you go back, do your research: what is available, what is not available, what more should be built, how can you simplify it further?

Because if you are recommending a solution, people will ask for the ROI as well. What is ROI? How much you have invested versus how much benefit you are getting.

18:01 - Abhisshek Raaj
Right?

18:02 - Abhisshek Raaj
So, your solution should be light, it should not consume too much budget, also.

18:09 - Akshat Jain
yeah, you should have some ROI.

18:12 - Abhisshek Raaj
So I mean if I have to hit a nail, I'll use a small hammer, right? I do not use a 50 ton hammer to hit a small nail. That is a waste of effort. So think of it while designing the solution. What is the ROI? How much time effort you will take to build that solution? How much volume that solution can handle. So, when we are talking about SOP, how many SOPs can it handle? How many changes can it handle?

How many inboxes? How many documents? You get it. So, think along all those dimensions. Yeah. Yes, definitely think of all those things as a business problem, not just as a technology problem. Any other questions?

19:27 - Akshat Jain

While framing the solution, at some points there will be times when we have to compromise on either quality or latency, like giving responses or kind of a thing. So what should we prefer on or the guardrails or anything that we should have in latency kind of a thing like or six that we have to provide current only as a success metric, answer should be provided less than thirty seconds how you should approach any problem like this.

19:55 - Abhisshek Raaj
See, there are multiple things while solving a problem. You have your scope, right? You have the quality and you have the cost. So if you want to improve the quality, you want to improve the the scope, your cost will increase. Right yeah if you want to bring the cost down you want to keep the quality intact your scope will come down so there is a interplay right so while you are designing the solution keep that in mind what is it that you want to optimize for so maybe your solution could also tell that this is a basic version which can do so and so and it will be priced at x y z and a more premium version which can handle more volume, which can do less latency, right?

Which can handle more exceptions, but it will be priced at this. Right? So, any product you think of, any product you think of, any subscription that you take, there is a premium subscription, right? It is free to an extent, and then you have to pay for things. That is what a good solution is. Yeah? Any other question? Sorry, your voice is breaking. For some reason, I can't hear much. So any other question anyone has?

21:36 - Sudeb Bibaswan
Yes, sir. So to add to this, there is also one more factor of cost. You have quality, you have cost, and you have also have a couple of other factors. So how do you suggest we would look That is what I was talking about.

21:53 - Abhisshek Raaj
So when you are solutioning, you should think of all these parameters. You can create multiple layers, right? One could be a free solution, which will have limited capacity. So if an organization is of a small size, maybe they just want a SOP update, let's say every month, and that to one or two SOPs. You cannot treat them in the same way, you know, of a big client, which does it more frequently. You can have more features for them, and accordingly, you can price your product.

You understand? Be multiple tiers, multiple layers to that. Got it. Got it. Yeah.

22:29 - Sudeb Bibaswan
So the more premium solutioning will have more cost and likewise that's for and more effort and more more features, right? More features. Got it. Got it.

22:37 - Unidentified Speaker
Yeah.

22:38 - Sudeb Bibaswan
So so we'll have so we'll have like the more quality and less tightening solutions with a more price with the higher tiers.

22:45 - Abhisshek Raaj
And that is that is what that is what even we do in our daily life as well. Right, right, right. Why do you why do you pay let's say uh fifty lakhs for a BMW versus a three lakhs for a Maruki? Right, right. They do essentially the same thing, right? Right.

23:03 - Sudeb Bibaswan
Right. Actually, you asked us to think it from a business point of view. Yes, you have to think from a business point of view,
